

Towards Spatiotemporal Science: A Preliminary Investigation

Chaowei Yang

NSF Spatiotemporal Innovation Center

George Mason University

杨超伟

美国国家基金会时空协同创新中心

乔治梅森大学

<https://www.stcenter.net/>

Agenda

1. Global grand challenges
 - 1.1 Climate change, urban heat island, and air quality
 - 1.2 The COVID-19 Global pandemic
 - 1.3 Asteroids and man-made space objects
2. A formal and sustainable approach
3. Towards a science domain
4. Questions, Comments, Suggestions

1.1 Urban Heat Island

Jingchao Yang

Hanoi City, Vietnam (Lee et al., 2017)

What Is an Urban Heat Island? | NASA Climate Kids

Heat wave in Cook County, Chicago
 (EPA, Climate Change Indicators: Heat-Related Deaths)

Number of deaths by risk factor, World, 2017
 Total annual number of deaths by risk factor, measured across all age groups and both sexes.

<https://ourworldindata.org/air-pollution>

New Orleans
 (EPA, Heat Island Impacts)

Li et al., 2018

A spatiotemporal science approach

ST Kriging & many others

$$Z(s_0) = \sum_{i=1}^N \lambda_i Z(s_i)$$

Weights the surrounding measured values to derive a prediction for an unmeasured location

Jul 25-28, 2019 LA, CA

Initial Results: Model Comparison

• Single-point Continuous Prediction (Next 1 Hour)
LSTM yields the best prediction result

- minimum RMSE
- highest R²

Selected for the further multi-step forecasting algorithm with multivariable.

8 parameters with 12 neurons

A Spatiotemporal Science Approach

Result analysis

Taken VA as an example (K)

POI analysis (area > 900 m², number of POIs : 5901/11909)

Solutions at the
Building Level

1.1.2 Climate Change & Air Quality

Air Quality Problem: An Example of PM2.5

- PM2.5 - a major **public health concern** (Beelen et al., 2014)
 - 10 $\mu\text{g}/\text{m}^3$ up in $\text{PM}_{2.5}$ \rightarrow 9% up in risk for **lung cancer** (IARC, 2013; Turner et al., 2020)
 - Traffic related air pollution levels up \rightarrow lower **fertility rates** (Nieuwenhuijsen et al., 2014; Conforti et al., 2018).
- ~4.2 million **premature deaths** worldwide in 2016 (WHO)
 - ~200,000 **deaths** per year in the U.S. alone (Woodward and Levine, 2016)

~10,000 additional premature deaths

Number of People Living in Counties with Air Quality Concentrations Above the Level of the NAAQS in 2019

~82 million people nationwide lived in counties with pollution levels above the primary NAAQS in 2019

Problems

- 1. **No global coverage** gridded PM_{2.5} product (most satellite-based product are transferred from AOD and without ocean);
- 2. **No international standard** PM_{2.5} products collected from different countries and sensors.
- 3. **No high spatiotemporal observations** in key regions such as LA

Public & Industrial Interest

- Commercial companies leveraging air quality monitors and machine learning for real-time air quality monitors and short-term predictions

BreezoMeter Contact Us

When it Comes to Breathing, You Can't Afford to Get it Wrong

Empower individuals to make healthier decisions every day with the world's most trusted environmental intelligence.

openaq Home Why open air quality? Open data Community Blog About us [Get involved](#)

[New](#) We have low cost sensor data! [Explore data](#) [Read blog post](#)

Fighting air inequality through open data and community.

OpenAQ is a non-profit organization empowering communities around the globe to clean their air by harmonizing, sharing, and using open air quality data.

A Spatiotemporal Science Approach

Forward propagation (prediction)

Backward propagation (learning)

Sensitivity test: Input predictor

- Step 1: add 10 PCs each time from 10 to 150 PCs. Lowest MSE appears when PC number is between 60 and 90.
- Step 2: add 1 PC each time from 60 to 90, repeat 20 times. Average MSE become lowest when PC number is 77.

The top **77 Principal Components (PC)** are used as predictors (instead of the totally 2211 channels)

Sensitivity test: Iteration/epoch number

- The test accuracy does not change after 8th iteration, the training accuracy still increases.
- To avoid overfitting, training is stopped at the 60th epoch of 8th iteration.
- The training took 4-5 days, producing results is relatively fast.

Global Level Variable Retrieval Jun. 1~7 2020

Test accuracies of use cases from Jun. 01, 2020 to Jun. 07, 2020.

Prediction

➤ Performance is stable and reliable for all use cases:
MSE~0.02, Pearson's R~0.92.

Get down to street level

1. 2. 2 How effective are different policies and vaccine?

A Spatiotemporal Science Approach

- ❖ The seven policies in the main study of interest were denoted by *school*, *work*, *event*, *transport*, *campaign*, *home*, and *travel*, *vaccine*, and *air quality*.

$$\begin{aligned} & \text{ConfirmedGR}_{sd} \\ &= \alpha + \text{state}_s \\ &+ \left(\sum_{i \neq 0} \beta_{1i} \text{school}_{sdi} + \sum_{i \neq 0} \beta_{2i} \text{work}_{sdi} + \sum_{i \neq 0} \beta_{3i} \text{event}_{sdi} + \sum_{i \neq 0} \beta_{4i} \text{transport}_{sdi} + \sum_{i \neq 0} \beta_{5i} \text{campaign}_{sdi} \right. \end{aligned}$$

...

Impacts of policies/vaccine on mobility, outbreak, and mortality

Stay-at-home orders:

- significantly decrease mobility in the first three weeks
- significantly decrease confirmed case growth rate

Workplace closures:

- significantly decrease in mobility
- non-consistent changes in mobility

Public event cancellations:

- significant changes in mobility
- significant results in the confirmed case growth rate after one month

Public transport closures

- significant changes in mobility
- no significant impacts on case growth rate

School closures and international/national travel

- impact on mobility were not significant
- impact on confirmed case growth rate were not significant

Public information campaigns:

- had little to no effect on mobility
- effectively reduce the COVID-19 confirmed case growth rate
- It indicates that this policy can significantly impact COVID-19 trends through channels other than changes in mobility

Counterfactual analysis: state-specific time trends for the confirmed case growth rate

- Good fits between the predicted confirmed case growth rate and the observations.
- Large gaps between the predicted curves with and without policies

Graphs by StateName

Effectiveness of vaccination

- Red vertical line represents the reference period.
- Black square symbols describe the point estimates (along with their 95% confidence intervals).
- shows that there were significant decreases in the daily COVID-19 case growth rate after the initial shots of the vaccine, with 0.124, 0.347, 0.345, 0.464, 0.490, and 0.756 percentage point declines in the 1-5, 6-10, 11-15, 16-20, 21-25, and 26 or more day post-periods after the start of vaccination

Analytical results: three NO₂ clusters in the global scale

Spatial distribution of three clusters derived from long-term monthly mean NO₂ TVCD

Heterogeneous impacts of policies in the poor

Hai Lan

- Reopening is complicated by the known high infectivity of the virus, complicating our ability to ensure the health and safety of students, employees, and families.
- Lack of timely and scientific information to support schools reopen decision making and control strategies design
- It is crucial to **predict COVID-19 spread trajectories** based on specific school/campus thus support decision making with risk level assessment and policy recommendations

1.2.3 School Reopen

GMU Simulation

A Spatiotemporal Science Approach

- Predicted COVID-19 cases trajectory C_p on studied campus/school :

$$C_p = \sum_t C_t \cdot I_{p,t} - \sum_t N_{quarantine,t} + \sum_t N_{recovered,t}$$

- Where each individual I

$$I = \{I_{id}, I_p, I_{inc_pd}, I_{age}, I_{symp}, I_{x,y}(t), I_{target}(t), I_{vac\ date}, I_{infdate}\}$$

on campus follow the daily activity setup in the simulation.

- While the probability of infection of each individual I_p for each contact is calculated by local R_0 , corresponded contact matrices K , age group I_{age} and also impacted by enforced control policies. Hence,

$$I_p(t+1) = \begin{cases} 0.75 \cdot I_p & \text{if asymptomatic} \\ I_p(t) \cdot e \cdot p_b & \text{if building capacity ctrl} \\ \gamma \cdot e \cdot I_p(t) & \text{if social distancing} \\ I_p(t) \cdot e \cdot p_{mask} & \text{if masking} \\ I_p(t) \cdot e \cdot p_s & \text{if Hygiene} \\ \gamma_v(t) \cdot I_p(t) & \text{if vaccinated} \end{cases}$$

- The individual status $I_n(t)$ updated as:

$$I_n(t) = \begin{cases} \text{"susceptible"} & \text{initial} \\ \text{"exposed"} & \text{incubation} \\ \text{"infected"} & \\ \text{"quarantine"} & \text{if symptom screening/viral testing/contract tracing} \\ \text{"dead"} & \text{if } P(\gamma_{mr}) \\ \text{"recovered"} & \text{if } 1 - P(\gamma_{mr}) \end{cases}$$

Policy Controlling Results

Masks Only

Viral Testing Only

Social Distancing Only

All combined without testing

Symptoms Screening Only

All combined

System and Result Evaluation

Parameter	Value
Timesep	60
Days	10
Total infected people	510
Number of infected people on campus	510
Infected and showing symptoms	13
Infected but not showing symptoms	497
People in quarantine	0
Dead	0

System link: <https://smartgateway.stcenter.net>

1.2.4 How was the environment impacted?

- **Challenges:**

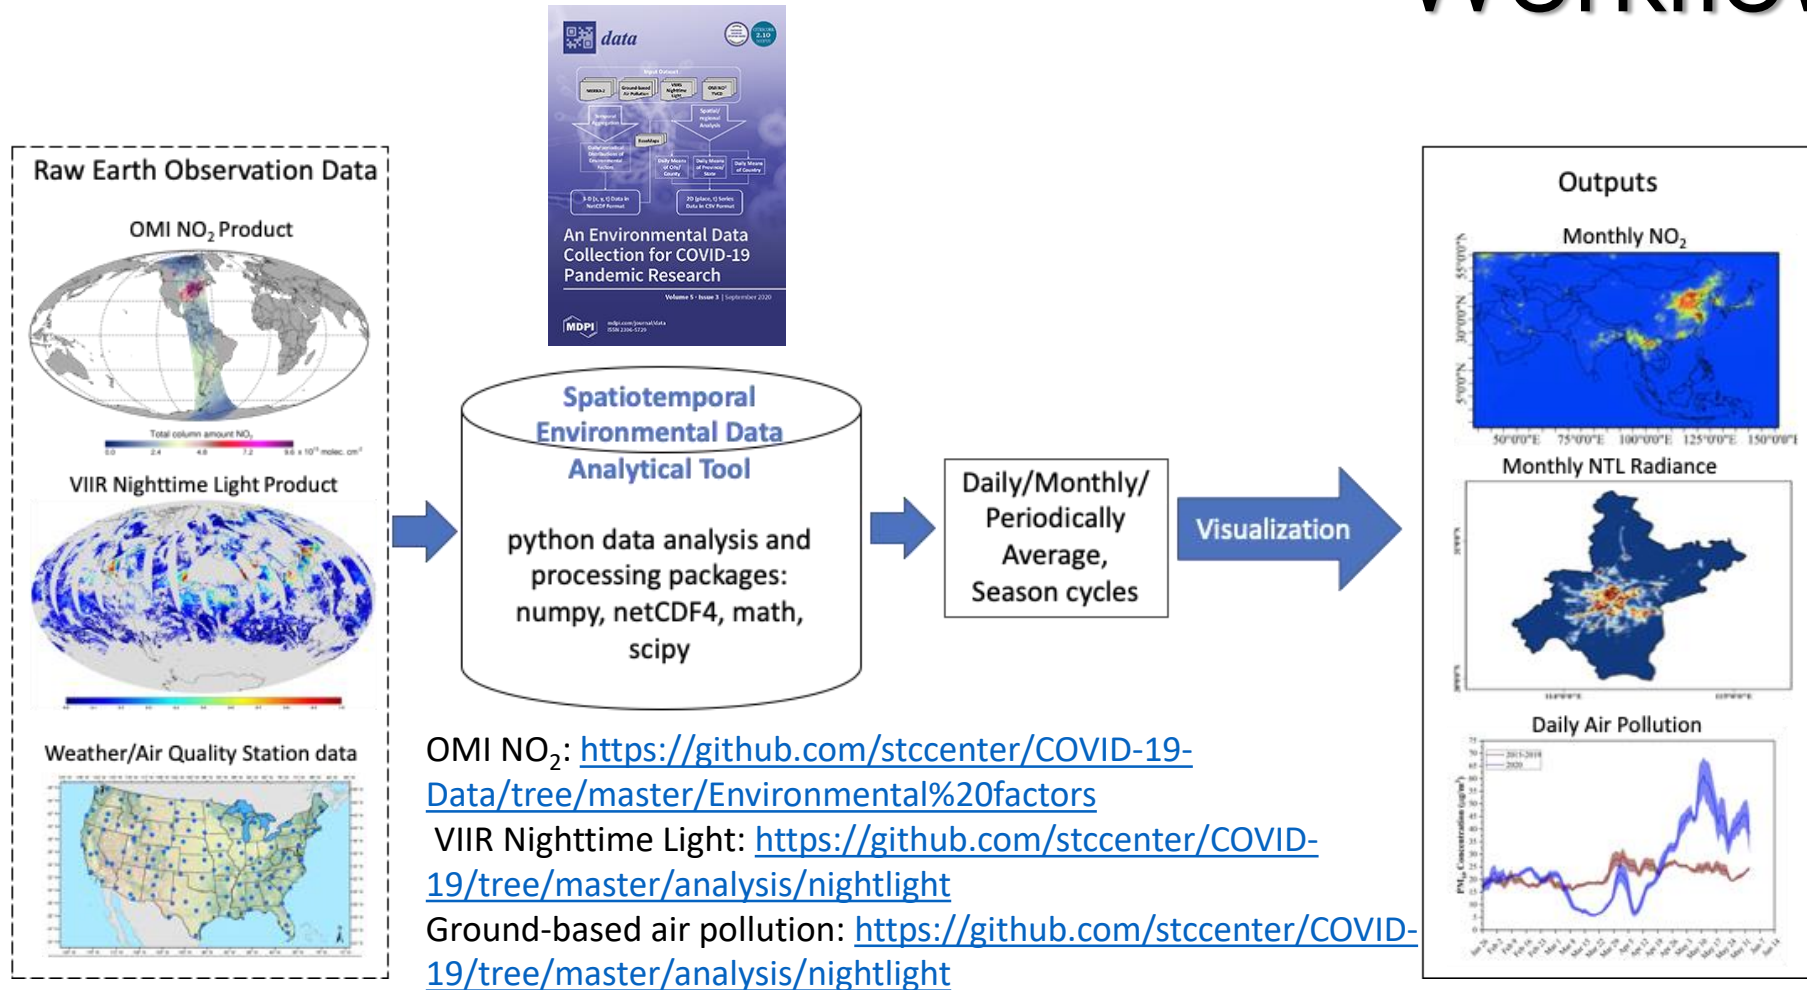

- How different environmental factors are changed by COVID-19?
- Do they have similar responses in different regions?
- How to explain the changes?

- **Motivation:**

- The factors are essential indicators of industrial production and global economic;
- Results can offer vital and practical basis for loss assessment and economic reopening and planning.

Workflow

Liu, Q., Liu, W., Sha, D., Kumar, S., Chang, E., Arora, V., Lan, H., Li, Y., Wang, Z., Zhang, Y., Zhang, Z., Harris, J., Chinala, S. and Yang, C., 2020. An Environmental Data Collection for COVID-19 Pandemic Research. Data, 5(3), p.68.

A spatiotemporal science approach

a. Spatiotemporal dimension generalization

b. Spatiotemporal average

- $\overline{EF}_t = \frac{\sum_{i=1}^m \sum_{j=1}^n EF_{i,j,t}}{m \times n}, t = 1, 2, 3, \dots, T_{study}$

c. Time period spatiotemporal average

- $\overline{EF}_{i,j} = \frac{\sum_{t=T_{period\ start}}^{T_{period\ end}} EF_{i,j,t}}{T_{period}}, i \in [0, m-1], j \in [0, n-1]$

d. Spatiotemporal anomalies

$$A_{i,j} = \overline{EF(i,j)}_{p,y} - \overline{EF(i,j)}_{p,2010-2019},$$

China air quality impact

Heatmap of the Air Quality Index on Jan. 01, 2020

Heatmap of the NO2 Emission on Jan. 01, 2020

CA AQ Impact

- Impact on air quality in the U.S.

Liu, Q., Harris, J.T., Chiu, L.S., Sun, D., Houser, P., Yu, M., Duffy, D., Little, M., and Yang, C., 2020. Spatiotemporal Impacts of COVID-19 on Air Pollution in California, USA. *Science of the Total Environment*, p141592

Global Impact on NO2?

	Relative difference between peri- and pre-period (%)		Relative difference between post- and peri-period (%)	
	2020	2010-2019	2020	2010-2019
China	-50%	-38%	-23%	-41%
USA	-43%	-44%	4%	-8%
South Africa	33%	45%	6%	3%
Brazil	14%	17%	3%	4%
India	-9%	3%	-5%	-10%
Germany	-60%	-50%	-39%	-44%
Russia	-67%	-66%	-30%	-20%

- Mean tropospheric NO₂ of most target countries **significantly decreased** (<-5%) during the lockdown, such as China, South Africa, India and Germany.
- Brazil and Russia **slightly declined** by 3% and 1% during lockdown.
- The USA **increased** by 1% during the lockdown.
- After the reopening, the NO₂ **rebounded in most target countries** (>5%) except South Africa, Brazil and Russia.

5/21/2021

Liu, Q., et al., 2020. Spatiotemporal Changes in Global NO₂ Emission Due to COVID-19 Mitigation Policies. Environment International, STOTEN.

1.3 Protecting our home planet

- 1) Asteroids
- 2) Man-made objects
- 3) Our understanding
- 4) The dilemma

Asteroids

[These are the asteroids to worry about - YouTube](#)

Man-made Objects

What we know?

- PD instruments: ~ 660 instruments
- Missions: Over 300 missions
- Including instrument types such as: Visible Cameras, IR Cameras, LIDAR, Magnetometers, Spectrometers, Analyzers, Multispectral Imagers, Detectors, Satellites, Monitors, and other instruments.

Missions	Mission Types
Deep Impact (EPOXI)	PD
Mars Odyssey	Mars
AIM	Cloud
AlSat-2 (Algeria Satellite-2)	Earth Observation
OSIRIS-Rex	Asteroid
AstroSat	Space
CartoSat-2A	Earth Observation

- Includes parameters such as: instrument type, instrument name, mission sponsor, mission flew, instrument provider, mission launch date, mass, power, dimensions, roles/capabilities, instrument composition, mission type, characteristics, comments, and the information source.

- Future work: Add the Instruments and Missions content to the PD Knowledge Base and continue work with Neo4J

MAGNETOMETERS

Instrument Type	Instrument Name	Provider	Mission Flew	Year	Mass	Power	Dimensions	Characteristics Role/Capabilities
Magnetometer	AMR Magnetometer	developed at LusoSpace, Portugal [1]	Aeolus / formerly ADM (Atmospheric Dynamics Mission)	launched on 22 August 2018 (21:20 GMT) [1],	300 g [1]	1 W [1]	85 mm x 53 mm x 60 mm (excl. connectors) [1]	"The magnetometer is a small (credit card surface dimension) and robust unit that can be used for several LEO missions" [1].
Characteristics	Characteristics	Characteristics	Characteristics	Cost	Comments	Information Source		
Instrument Affiliation	Composition Makeup	Characteristics	Cost	Comments	Information Source			
	"Possibility to generate external magnetic field in the chip by mean of built in coils" [1]	Bandwidth: up to 40 Hz (adjustable) [1]		Includes bandwidth from source 1. Mission type: Earth observation/wind.	[1] https://directory.eoportal.org/web/eoportal/satellite-missions/a/aeolus			

The Dilemma

- We still miss many asteroids.
- We can't predict accurately where they will hit.
 - Good chance in ocean 7/10, but [How much of the earth is covered by city?](#)
 - *1% (half population), 0.3% (urban area)* [Population distribution](#)
- We don't have an efficient mechanism (tools & diplomatic channels) to mitigate.
- A deeper **spatiotemporal science approach** is needed to obtain a comprehensive understanding.

2. A formal and sustainable approach

A Spatiotemporal Computing Infrastructure

GMU Data Center

Three Computing Clusters designed for different purposes in GMU Datacenter contain *3024 cores*, *8Tb memory* and *220Tb Storage* in total:

- Hadoop Distributed Filesystem based **Cloud Computing** environment (CDH)
- Message Passing Interface powered **High Performance Computing** cluster (HPC)
- OpenStack based **Cloud Sharing Platform** (Cloud)

AWS

- Amazon has sponsored credits to our center to use AWS modules such as EMR, EC2, P3, and S3.
- Resources are utilized for publishing data, providing application services for public users.

Microsoft Azure

- Azure modules such as VM and Database, are utilized for publishing data, providing application services for public

Community Building

- 12 Training Programs Since 2012, Latest Nov. and Dec., 2019
 - 200 professionals
 - 100 Speakers
 - Engaged 3 countries & UN
 - Approximately 20 Organizations: GMU, Harvard, UCSB, USC, ESRI, USGS, Microsoft, etc.
- Symposia on Spatiotemporal Thinking, Computing and Applications
 - 9 time at AAG annual meeting
 - Average 10 sessions per year
 - Engaged total 7000 person times
- International Symposium on Spatiotemporal Computing
 - Two times, with this cancelled for the Pandemic
 - Approximately 120 participants each year
 - Publish with ISPRS and indexed by Web of Science

3. Towards Spatiotemporal Science

- Research & Development
 - **Theories such as ST-Texts**
 - **Technologies such as Smart Cities**
 - Applications such as Pandemic
 - Papers
 - Books & Texts
- Education & Curriculum
 - Graduates
 - Undergraduates
 - K-12 & Teachers

Community Building

Expert Meeting
ISSC series
ST symposium
Webinars

- Patents & Licenses
 - **Open Source**
 - **Commercial**
 - **Results adopted by members**
- Create business
 - Students
 - Collaboratives
 - **I-Corps**
 - **STTR/SBIR**
- Entrepreneur
 - **GOALI**
 - **PIRE**
 - **INTERN**

- Building and strengthening the spatiotemporal infrastructure
- Innovation towards solution & commercialization
- Address grand challenges, e.g., public health, natural hazards, geospatial intelligence
